checkpoint 把中间结果 存入hdfs(大概类似于 还原点)setChekpointDir.

从RDD Object 到 TaskScheduler 都是在driver端 worker下的execute执行任务,被提交到具体的执行端

图二:

spark 对比yarn

跟yarn类比:

Master负责资源调度(决定在哪些Worker上启动executor)、监控Worker —— ResourceManager Worker负责启动执行任务的进程(Executor),并且监控Executor,并且将当前机器的信息通过心跳汇报给Master —— NodeManager Executor负责执行计算任务的 —— YarnChild SparkSubmint负责向Master提交任务并申请资源,然后该任务下的Executor跟SparkSubmit进行通信,监控Executor —— AppMaster
